Paper Title
Fail-Closed or Fail-Degraded? A Simulation Study of Forced Assurance Loss in Contested Multi-Hop QKD Networks

Reviewer #1

Questions

1. Is the paper in IEEE conference template format ?
Yes

2. Is the paper directly relevant to the core themes of WiCOMM-2026, such as advanced communication systems, Defence electronics, or related tracks?
Highly Relevant

3. Does the paper present novel ideas, new algorithms, or innovative applications of existing techniques?
Original and significant contribution

4. Are the mathematical derivations, system designs, simulations, and experimental validations technically correct and robust?
Sound and fairly good

5. Is the paper well-organized, logically structured, and clearly written in standard English? Are the figures, tables, and graphs legible and well-explained?
Good

6. Does the paper adequately cite prior work, especially recent literature and foundational research?
Excellent / Completely sufficient

7. What is your final recommendation for this paper?
Weak Accept

8. Indicate your level of expertise regarding the specific technical domain of this paper.
High

9. Provide constructive feedback. Highlight the strengths and weaknesses of the paper. Include specific suggestions for improvement regarding methodology, results, or formatting. (Note: Do not state your final accept/reject recommendation in this box).
The core question is valid and unaddressed: when a multi-hop QKD network exhausts key, should it refuse service or serve at reduced assurance? The forced assurance loss

metric is a
reasonable addition. Concerns list in uploaded file are about evidence scope and framing, not simulator correctness.
