Manuscript Toolchain Verification

Isolated Test Document
Not a research manuscript

Abstract—This isolated document verifies two-column rendering, mathematical glyphs and an embedded table. It contains no research findings.

Index Terms—Document preparation, verification

I. Rendering Check

An editable manuscript needs consistent text and equations. The capability variable is Δe, and the illustrative expression is

$$e_i(t) = e_0 + \Delta e. \tag{1}$$

TABLE I
Isolated check

Item	Value
Columns	2
Fonts	Embedded

II. Interpretation

Passing this check establishes only that the local renderer can produce a PDF from a small IEEE-style source. Final page count, content agreement and visual quality must still be checked on the finished manuscript. See Section I, Equation 1, Table I, and the sample reference [1].
