Manuscript Toolchain Verification

Isolated Test Document
Not a research manuscript

Abstract - This isolated document verifies two-column rendering, editable mathematical glyphs and an embedded table. It contains no research findings.

I. Rendering Check

An editable manuscript needs consistent text and equations. The capability variable is shown below using native Word equation markup.

$$e_{\mathrm{i}}(t) = e_0 + \Delta e$$

TABLE I
ISOLATED CHECK

Item	Value
Columns	2
Equation	Editable

II. Interpretation

Passing this check establishes only that the local renderer can produce a PDF from an editable Word source. Final page count, content agreement and visual quality must still be checked on the finished manuscript.
